01 UI Screens and Code

1.Login Screen The **Login Screen** allows existing users to authenticate and access their TravelMate account. It features text fields for entering the user's email address and password, a "Login" button to trigger authentication, and navigation options for password recovery or navigating to the Sign Up screen for new users.

2. Sign Up Screen The **Sign Up Screen** enables new users to register for a TravelMate account by providing their personal details, including full name, email address, and a secure password. Upon successful

registration, users are redirected to the main explore screen to begin planning their trips.

3.destination Details The **Destination Details** interface displays detailed information about a selected destination, including its image, location, rating, description, travel information, estimated cost, weather, and popular attractions. Users can also save the destination or add it to their trip.

4.Create trip The **Create Trip** interface allows users to enter the main details of their trip, including the destination, number of travel days, budget, and preferred interests such as attractions, restaurants, activities, and events. It validates the entered information, then uses it to generate a personalized daily trip plan that opens in the Daily Itinerary screen.

The screenshot shows a mobile app interface for creating a trip. At the top, the status bar displays the time 9:41, signal strength, and battery level. The app header includes a back arrow and the title 'Create trip'. Below the header, a subtitle reads 'Tell us about your trip and we'll build your plan.' The form consists of several sections: a 'Destination' field with a location pin icon and the text 'Santorini, Greece'; a 'Number of days' section with a minus button, the text '5 days', and a plus button; a 'Budget' field with the text 'SAR 3,000'; and a 'What do you like?' section with four buttons: 'Attractions' (checked), 'Restaurants', 'Activities' (checked), and 'Events'. At the bottom is a large teal button labeled 'Create plan'.

5. Daily Itinerary

The **Daily Itinerary** screen displays the planned activities for each day of the trip, including their times and estimated costs. Users can switch between days, add or remove activities, view locations on the map, and check the cost summary.

6.Trip cost summary

The **Trip Cost Summary** interface displays the estimated total cost of the trip, broken down into activities, accommodation, transportation, and restaurants. The cost updates automatically whenever the user adds or removes an activity from the daily itinerary, helping users stay within their budget.

7.Saved Trips

The **Saved Trips** interface allows users to view and manage their planned trips in one place. Each trip is displayed as a card containing the destination image, trip name, travel dates, number of places, and trip duration. A navigation arrow allows users to access the details of a selected trip. The interface uses the same visual style as the Favorites screen, maintaining consistency throughout the TravelMate application while making trip information easy to scan and access.

8.Favourite

The **Favorites** interface allows users to easily access and manage their saved travel destinations. Each destination is displayed in a clean card containing a representative image, destination name, country, rating, and number of reviews. Users can use the heart icon to save or remove destinations from their favorites. The interface follows a simple Android design with rounded cards, soft colors, and clear typography to provide an organized and user-friendly experience.

Components and Libraries

Component / Library	Justification
Jetpack Compose	To build all application screens using Kotlin.
Material 3	To provide consistent buttons, cards, input fields, and colors.
Navigation Compose	To navigate between the application screens.
ViewModel	To manage screen data and handle user actions, such as adding or removing activities.
Kotlin Coroutines	To load and save data without blocking the user interface.
StateFlow	To provide updated UI state so screens display changes to activities and costs.
Room	To store saved trips, daily activities, and favorites locally on the device.
Firebase Authentication	To support user registration and login.
Google Maps Compose	To display an interactive map with markers for attractions and activities.

06

AI Use Disclosure

[ChatGPT](#) and [Gemini](#) were used to help create the user interface designs and explain the libraries planned for the application. They also helped draft the architecture diagram and navigation map based on my descriptions.
